

# SECURITY ASSESSMENT

HOW SECURE IS YOUR NETWORK? HOW DO YOU KNOW?

A security assessment and lifecycle review gives you a clear view of your current cybersecurity posture.

BlackHawk Data can show you where your network may have potential risks that could affect security in your day-to-day business activities and compares your risk versus that of industry peers.

## What can we see?

- Which applications are in use, and their potential risks to exposure.
- Specific details on the ways cyber criminals are attempting to breach the network
- Key areas to focus on for reducing risk exposure
- How to minimize current and future security risks

BlackHawk Data helps you gain full understanding of which applications are being used, including any 'shadow' applications, that may not have been authorized by your IT department.

Our security assessment shows your URL traffic and content types, and catalogs all potential threats on your network — known and unknown — and those linked to user behavior.

Best of all, it will give you recommendations for dealing with the risks that are identified so you know you are really secure..
